

ADDITIONAL TERMS FOR ZINC-CONTAINING RAW MATERIALS

Edition November 2019

Specification of material: According to usages and classifications of metal trade (UKM / version 2012)

A cadmium content of more than 250 g/t is not allowed.

Radio activity clause:

Irrespective of all contrary clauses, which set aside or restrict the responsibility of the seller, **he guarantees** that secondary materials, which are concerned by the sale, are **free from any nuclear contaminations, free from any ionizing radiation, which exceeds the natural proper radiation of the secondary materials and free from all kinds of explosive materials.**

The materials, which do not correspond to this guarantee, must be taken back by the seller at his own cost.

Moreover, the seller is liable to the buyer and will compensate him for any damages caused by radioactive contaminated secondary materials or explosive materials, especially disposal costs.

Weighing, Sampling and Analysis:

The weights and analysis determined at the receiving smelter will be decisive for settlement. After the sampling operations are concluded the receiving plants are entitled to process the goods immediately.

We point out that the material, if necessary, has to be marked according to the regulations of determination of residual material (KrW-/AbfG) and that the transport has to be effected according to GGVS/ADR.
